

ADR Reporting & Documentation

Pharmacovigilance Task

Objective

Complete a structured Adverse Drug Reaction (ADR) reporting form based on a given patient case scenario. This task demonstrates the basic documentation process used in pharmacovigilance and medication-safety activities.

Structured ADR Reporting Form

Section	Information to Document
1. Patient Information	Patient initials/identifier, age, sex, weight, relevant medical history.
2. Suspected ADR	Description of the adverse reaction, signs/symptoms, onset date, duration and severity.
3. Suspected Drug	Drug name, strength, dosage form, route, dose, frequency, indication and therapy start date.
4. Timeline	Relationship between drug administration and onset of the reaction.
5. Concomitant Medicines	Other medicines, supplements or therapies being taken at the time of the reaction.
6. Seriousness	Record whether the event involved hospitalization, death, life-threatening condition, disability, congenital a
7. Dechallenge/Rechallenge	Document whether the reaction improved after stopping/reducing the suspected drug and whether it return
8. Outcome	Recovered, recovering, not recovered, recovered with sequelae, fatal, or unknown.
9. Causality Assessment	Assess the likelihood that the suspected medicine contributed to the reaction using the available clinical in
10. Reporter Details	Reporter role/profession and relevant contact or institution details, according to the reporting system requi

ADR Documentation Checklist

- Patient details reviewed
- Suspected drug identified
- Reaction described
- Timeline assessed
- Seriousness assessed
- Concomitant medicines reviewed
- Dechallenge/rechallenge documented when available
- Outcome documented
- Relevant medical history recorded
- Report reviewed for completeness

Importance of ADR Documentation

Accurate and complete ADR documentation helps identify potential medicine-related safety signals, supports pharmacovigilance activities, and contributes to safer use of medicines. Reports should be based on available case information and should clearly distinguish known facts from information that is unavailable.

Conclusion

A structured ADR report should capture the patient, suspected medicine, adverse reaction, timeline, seriousness, management, outcome and reporter information. Consistent documentation supports effective pharmacovigilance and patient safety.

Note: This is an educational template. Patient-identifying information should not be entered into a public repository. Use anonymized or fictional case information for training submissions.
